

# An approach to achieving the IHI's The Triple Aim for a given population – This is from Palmetto Health, a not for profit provider based in South Carolina and shows how they went about segmenting their population

A **population**, for which claims data exists and achieving Triple Aim results will not result in perverse economic loss.

*Cannot be defined by a clinical condition (Diabetes) or issue (readmissions).*

A **sub-population**, high cost and or high utilization people from the larger population.

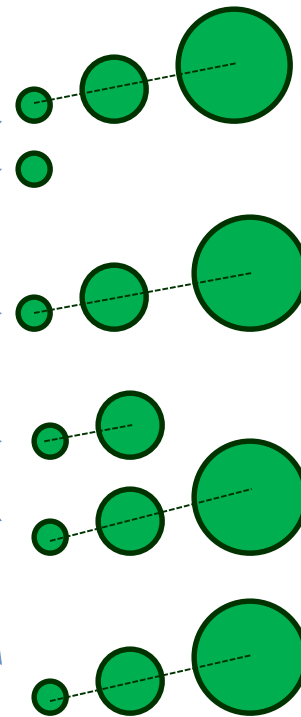

*People who have "fallen through the cracks" of our "rescue-care" system.*

**Sub-groups**, people from the high cost high utilization sub-population that can be stratified based upon relatively similar needs.

*Sub-groups based more on needs and less on conditions.*

**Interventions** intended to address the needs of high cost high utilization sub-groups, Plan Do Study Act cycles.

*Some interventions will work and some will not. All should result in learning and start on the smallest practical scale.*

**Note:** The size of the rectangles is meant to be indicative of population size, not cost.
